

Demo run result

One lot of Kalanamak rice, from the farm gate to a sealed QR code, run on 3 October 2026

QR code

GV-D3C38791036F

Result	Sealed domestic Pass export Pass
Crop	Kalanamak rice · GI 280 · Eastern UP Terai belt (Siddharthnagar)
Scope	Kharif 2026 (KH26) · Siddharthnagar · GrainVeda (Prasaadam trade scope)
Farmer	Sita Devi, Itwa, Siddharthnagar (PRSDM-F-0002)
Quantity	147.5 kg bought → 147 kg sealed (0.5 kg lab sample)
When	3 October 2026, 5:09 pm IST
Public page	mvp-beta-one.vercel.app/verify/GV-D3C38791036F
Ledger	10 new blocks (#63 to #72), chain intact
Prepared by	Claude (Claude Code) for Veda

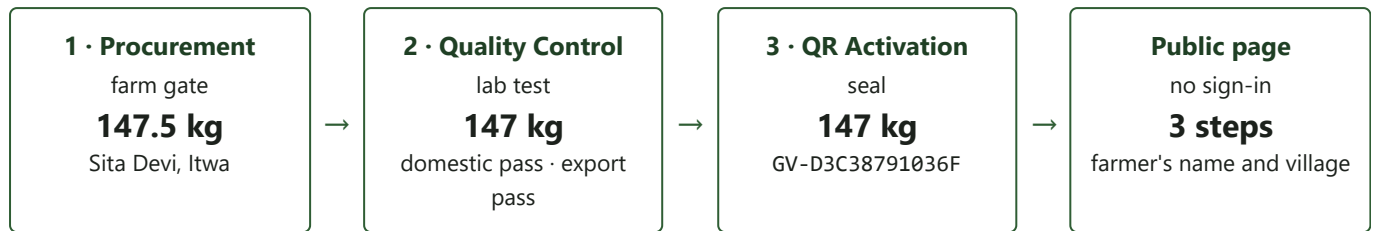

The lot's printed label, as the live app draws it. Scanning it opens the public page.

How this demo was run, in one line. The three stages were recorded in the staging database as the three demo operators, not typed into the app's screens. Every database rule applied. Section 2 explains why and what that means.

This lot is permanent. The ledger never deletes. It sits on the staging project, which is the practice system and holds demo data only.

1. Result at a glance

Check	Result	Detail
Three stages recorded in order	Yes	Procurement → Quality Control → QR Activation, each by its own operator.
Each stage checked by the next	Yes	The QC Technician verified the procurement lot; the QR Sealer verified the lab record.
Quantities worked out by the system	Yes	Net weight, moisture average and the quantity forwarded were computed by the database, not typed.
Quality verdict derived	Pass	Three readings judged against the scope's limits: domestic pass, export pass.
Lot sealed with a QR code	Yes	GV-D3C38791036F , fingerprint 893be61ba075a78f...
Public page on the live site	Works	Opens without sign-in; shows the journey and both verdicts; does not show the farmer's phone.
Rules refused what they must	2 of 2	A creator verifying the own record, and a QC technician sealing, were both refused.
Ledger chain	Intact	16 blocks on staging, 0 problems.
Signed-in screens of the live app	Partly	Home, dashboard, record, journey and labels open. One box on the dashboard fails (section 7).
Stages entered through the screens	Not done	Operators cannot sign in yet (section 8).

2. How the demo was run

The app is built for three different people to handle one lot: the operator who buys it, the technician who tests it, and the person who seals it. Each signs in with a phone number. Two things stood in the way of doing that through the screens today:

- The Phone provider is switched off on the staging project, so no operator can sign in.
- Signing in to a hosted service with a password is a step I am not permitted to take.

So the run used the project's own end-to-end test as its script (test "T1" in `tests/remote_r1s.mjs`), carried out directly in the staging database:

#	Step
1	Trial, fully rolled back. The whole journey was run once and undone. It returned the complete result; staging was unchanged afterwards (0 records, 0 seals).
2	Real run, one transaction. The same steps, kept. Either all three stages are stored or none.
3	Each step ran as its own operator. The caller was set to the Procurement operator, then the QC Technician, then the QR Sealer, so every permission, trigger and check applied exactly as it does to a signed-in person.
4	Read back and shown. The records were read from the database, then opened on the live app in your signed-in admin session, and on the public page without sign-in.

What this does and does not prove. It proves the database rules, the calculations, sealing, the ledger and the public page on the real staging system. It does not prove the entry screens: no form was filled in and no button was pressed by an operator.

All three records carry the same time, 5:09:05 pm, because the run was one transaction. In real use each stage has its own time.

3. The lot, stage by stage

#	Stage	Record	Recorded by	Checked by	In	Out	Status
1	Procurement (farm gate)	PRSDM-KNM-KH26-P-0001	Procurement operator	QC Technician	147.5 kg	147.5 kg	Verified
2	Quality Control	PRSDM-KNM-KH26-QC-0001	QC Technician	QR Sealer	147.5 kg	147 kg	Verified
3	QR Activation (seal)	PRSDM-KNM-KH26-QR-0001	QR Sealer	QR Sealer, at sealing	147 kg	147 kg	Sealed

What was entered, and what the system worked out

Stage	Entered by the operator	Worked out by the system
Procurement	Farmer Sita Devi · gross weight 150 kg · 1 bag · tare 2.5 kg per bag · moisture readings 11.9, 11.8, 12.0 %	Net weight 147.5 kg ($150 - 1 \times 2.5$) · moisture average 11.9 %, lowest 11.8 %, highest 12.0 % · record code
Quality Control	Quantity received 147.5 kg · lab sample 0.5 kg · moisture 11.9 % · broken grains 2 % · foreign matter 0.2 %	Quantity forwarded 147 kg ($147.5 - 0.5$) · the verdict for each market (section 4)
QR Activation	Nothing to enter: the stage confirms and seals	Final quantity 147 kg · QR code · seal block in the ledger

No warnings were raised on any of the three records, and no flag is open on the lot.

4. Quality verdict

The verdict is derived by the database from the lab readings and the limits set on the scope. Nobody types "pass".

Parameter	Reading	Domestic limit	Export limit	Domestic	Export
Moisture	11.9 %	≤ 13 %	≤ 12 %	Pass	Pass
Broken grains	2 %	≤ 5 %	≤ 3 %	Pass	Pass
Foreign matter	0.2 %	≤ 1 %	≤ 0.5 %	Pass	Pass
Overall	No manager override was used.			Pass	Pass

The moisture reading is 0.1 below the export limit: the lot passes for export by a narrow margin.

5. Seal and public page

Item	Value
QR code	GV-D3C38791036F
Sealed	3 October 2026, 5:09 pm IST, by the QR Sealer
Record fingerprint	893be61ba075a78f2d0af6205fcbdd44ddb8f036d9938e400a61a12ef41415c3
Public address	https://mvp-beta-one.vercel.app/verify/GV-D3C38791036F

This is what anyone sees after scanning the label, with no sign-in:

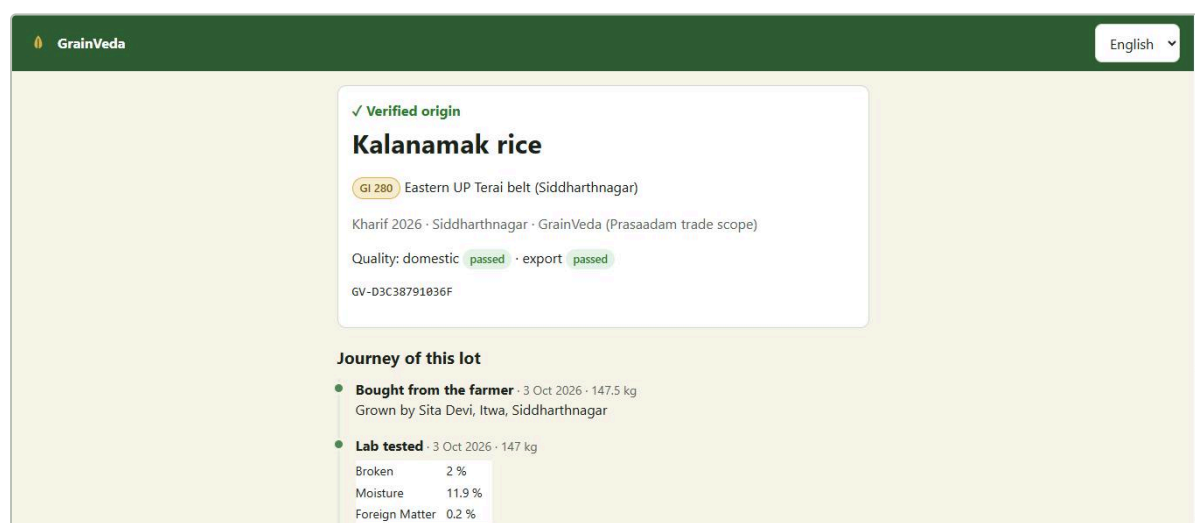

Figure 1. The public page on the live site, top. Verified origin, the crop and its GI number, the season and place, and both quality verdicts.

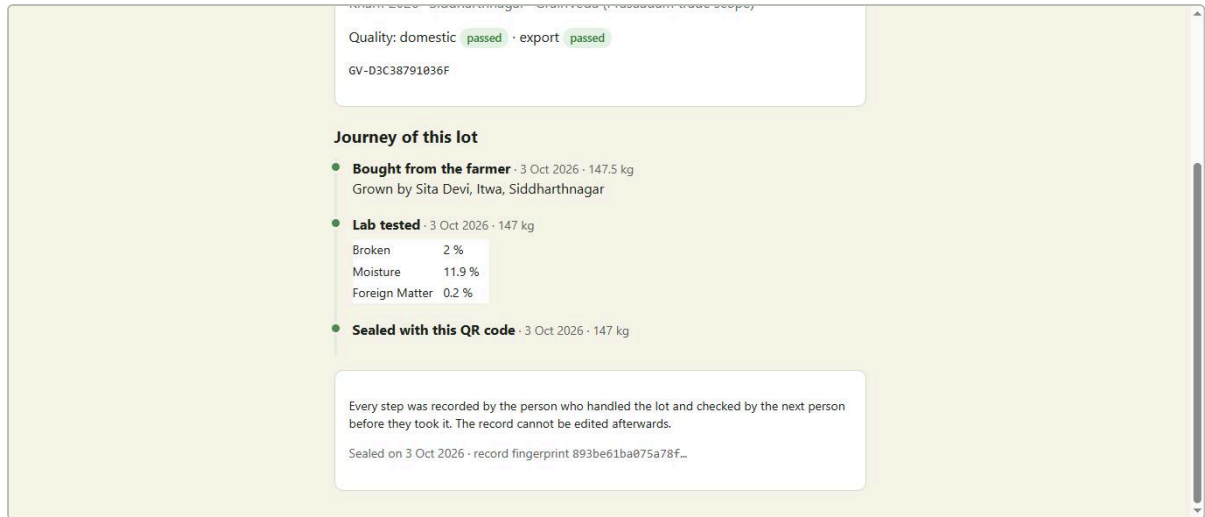

Figure 2. The same page, further down: "Journey of this lot". Bought from the farmer (147.5 kg, Sita Devi, Itwa), lab tested (147 kg, with the three readings), sealed (147 kg), and the record fingerprint. The farmer's phone number is not shown anywhere on it.

6. Rules that held, and the ledger

Two things were tried on purpose during the run that the system must refuse. Both were refused, with these messages:

Attempt	Outcome	The database's answer
The procurement operator verifies their own record	Refused	"may not verify a procurement record: verification is by the receiving stage"
The QC Technician seals the lot	Refused	"only the assigned QR operator (or a gateway role) may seal"

The ledger entries of this lot

Every action wrote one block. Each block carries the hash of the one before it, so a later change to any record breaks the chain.

Block	Event	Record	By	Hash (first 16)
63	Create	PRSDM-KNM-KH26-P-0001	Procurement operator	219cbde57d966faf
64	Verify	PRSDM-KNM-KH26-P-0001	QC Technician	0bdd312a9c9f2458
65	Close	PRSDM-KNM-KH26-P-0001	QC Technician	c7510a0bf2a82739
66	Create	PRSDM-KNM-KH26-QC-0001	QC Technician	dac678b1d96c3e61
67	Verify	PRSDM-KNM-KH26-QC-0001	QR Sealer	6f3b10dae3198e24
68	Close	PRSDM-KNM-KH26-QC-0001	QR Sealer	52544448619e0ce6
69	Create	PRSDM-KNM-KH26-QR-0001	QR Sealer	9d0958176ac2fb73
70	Verify	PRSDM-KNM-KH26-QR-0001	QR Sealer	02125ca840e0206f
71	Close	PRSDM-KNM-KH26-QR-0001	QR Sealer	f72855c3e93c4bbf
72	Seal	PRSDM-KNM-KH26-QR-0001	QR Sealer	893be61ba075a78f

The hash of block 72 is the "record fingerprint" printed on the public page. The chain check over all 16 blocks on staging reported **0 problems** after the run.

7. What the live app shows

These screens were opened on `https://mvp-beta-one.vercel.app` in your own signed-in session (Veda, Admin), by navigation only. Nothing was entered or changed through them.

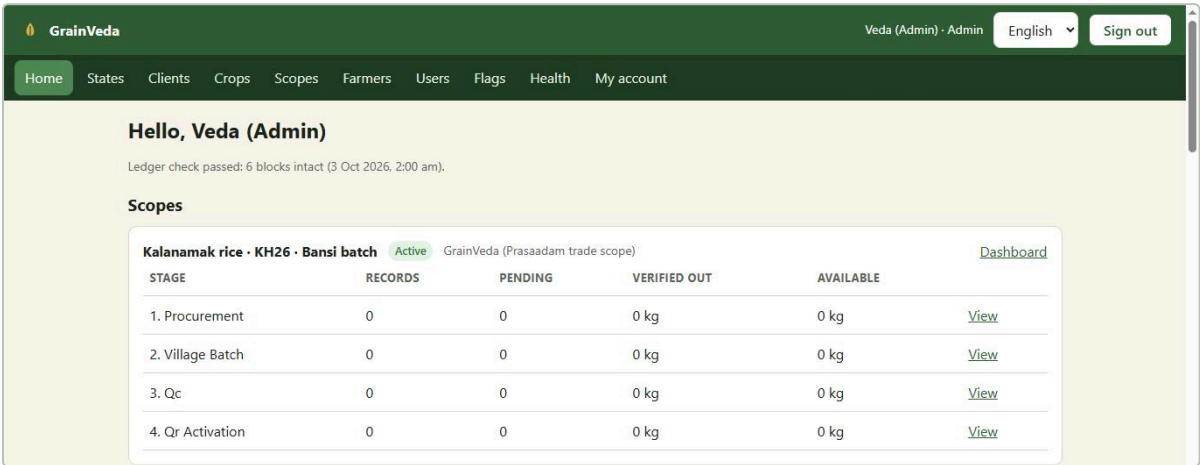

Figure 3. Home, signed in as admin. The six demo scopes are listed with their stages. The line under the greeting reports the last ledger check, made at 2:00 am, before this run.

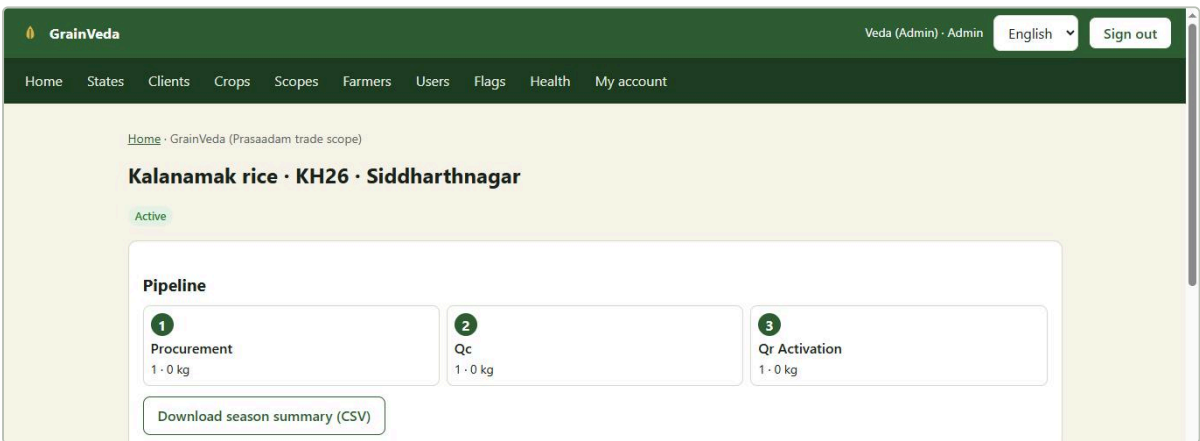

Figure 4. Dashboard of the scope, top. Kalanamak rice · KH26 · Siddharthnagar. Each of the three stages now holds one record; "0 kg" is what is still waiting at that stage, which is nothing, because the lot went all the way through.

Figure 5. The same dashboard, further down. The sealed lot is listed (147 kg, 3 Oct 2026) with links to its journey and public page. **The "Activity, last 14 days" box fails** with "Could not find the function app.scope_activity": the app is the Phase 4 build and the staging database does not have that function yet (section 8).

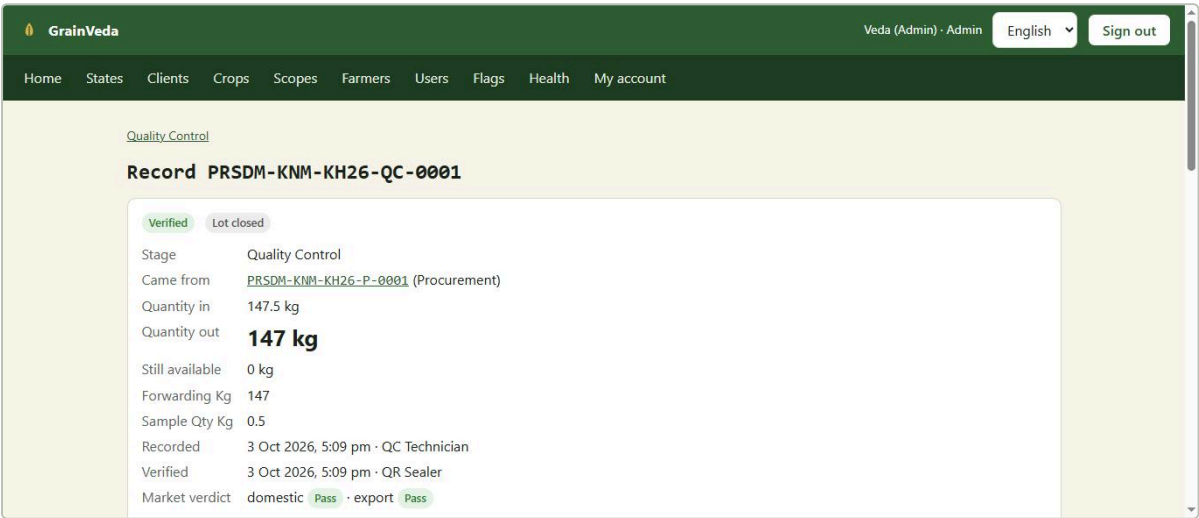

Figure 6. The Quality Control record. Verified, lot closed; came from the procurement record; 147.5 kg in, 147 kg out; who recorded and who verified it; market verdict Pass and Pass.

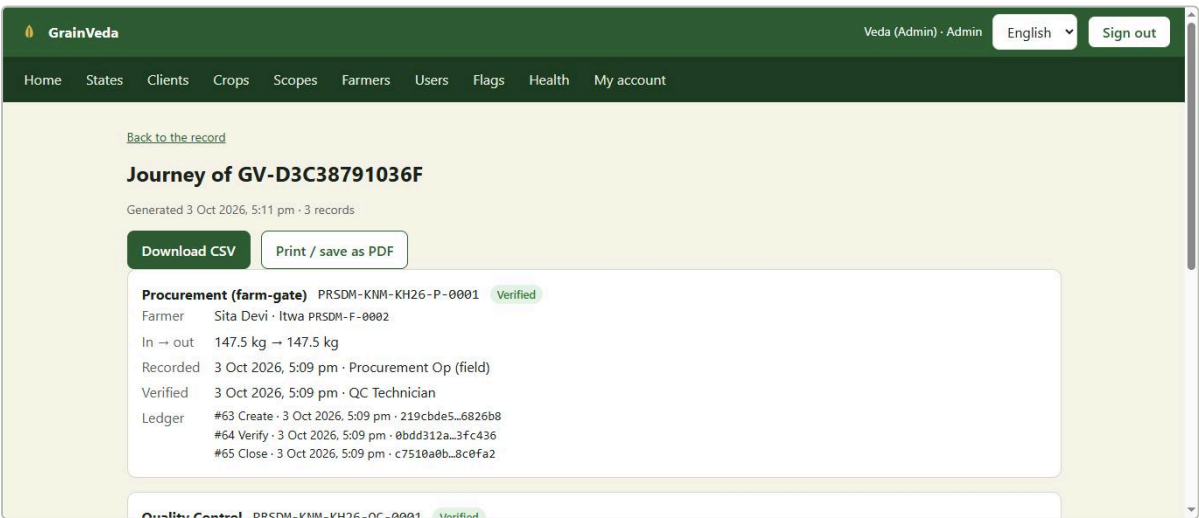

Figure 7. "Journey of GV-D3C38791036F". The manager's view of the whole lot, with the ledger entries under each stage and buttons to download it as CSV or print it. The first of its three cards is shown.

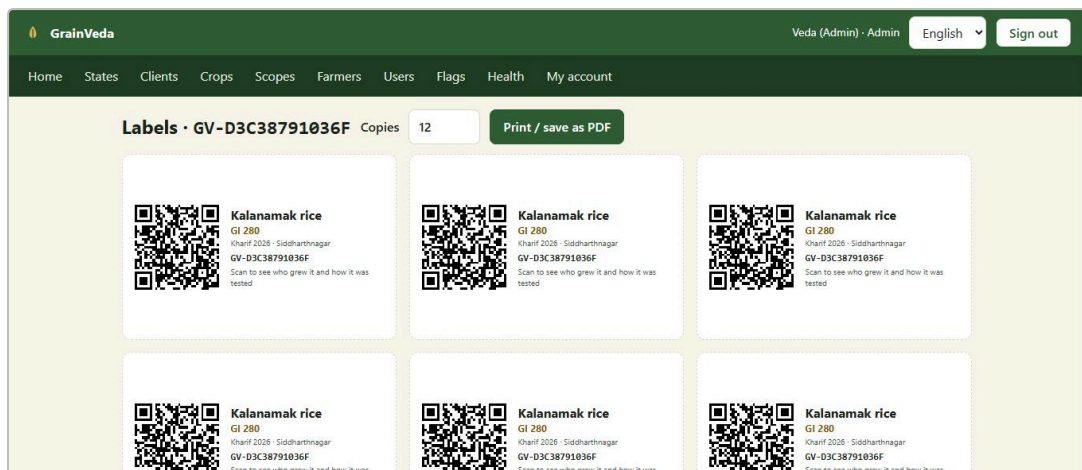

Figure 8. The label sheet. Twelve copies by default, ready to print; each carries the QR code, the crop, the GI number, the season and place.

8. What was not done, and what is next

Not done in this demo	Why
No stage entered through the app's screens	Operators cannot sign in while the Phone provider is off, and I do not sign in to hosted services.
No photo attached	The script records the data of the three stages only.
No longer chain	Five other demo scopes exist with more stages (sorting, grading, milling, packing, commercial, shipment, village batch, lot inward). None was run.
Nothing on a phone, nothing offline	The run was in the database; the screens were opened on a desktop browser.

To run the same demo through the screens yourself

#	Step
1	Supabase dashboard → Authentication → Sign In / Providers → enable Phone .
2	Bring the staging database up to the app: Part A of <code>docs/RUNSHEET_phase4.md</code> (six migrations and the <code>reset-password</code> function). This also clears the failing box in Figure 5.
3	Sign in as <code>0000000005</code> (Procurement) and record a lot; then as <code>0000000006</code> (QC) to verify and test it; then as <code>0000000007</code> (QR Sealer) to verify and seal. Passwords are in <code>.env.demo-logins</code> .

Where the evidence is kept

File, in <code>C:\Claude_outputs\demo-run\026-10-03\</code>	What it is
<code>demo_journey.sql</code>	The script that was run, with the trial / keep switch.
<code>demo_result.json</code>	The complete record read back from staging: records, verdict, seal, ledger, and the public page's data.
<code>1-...jpg</code> to <code>8-...jpg</code>	The eight screenshots used in this document.

The run is also written up in `docs/VERIFICATION_LOG.md` (not yet committed). No password appears in this document.
